

■ Olive CMA System Diagram

- 1 SQL-Server is employed for version management; all edits are saved for future restoration
- 2 Olive Development's Content Management Architecture (Olive CMA) controls the XML file creation
- 3 Olive CMA is web-based, accessible from any place in the world (24/7)
- 4 All content is cached in XML
- 5 Olive CMA separates the content (XML) from the design (XSL), allowing the same content to be used with multiple designs
- 6 Cache on Demand technology reduces the workload on the server; sites are more scalable
- 7 Pages are cached as XHTML (the quickest way to serve a page) the first time they are called by the browser
